feast (fēst), *n.* [< ME. *feeste, feste, fest*, < OF. *feste*, F. *fête* (see *fête, n.*) = Pr. *festa* = Sp. *fiesta* = Pg. It. *festa* = D. *feest* = G. Dan. Hence (from L. *festum*) *festal, festival*, etc.] **1.** A festival in commemoration of some important event, or in honor of some distinguished person; a set time of festivity and rejoicing. In this sense the word is almost entirely confined to ecclesiastical feasts. In the Jewish church the most important feasts, apart from the sabbath, were those of the Passover, Tabernacles, and Pentecost. Opposed to *fast*. To these were subsequently added the feasts of Purim and the Dedication. In the Christian church Christmas and Easter are feasts of almost universal recognition and observance. To these many others have been added, celebrating events in the life of Christ or in the lives of the apostles, saints, and martyrs. Feasts are divided into *movable* and *immovable*, according as they occur on a specific day of the week succeeding a certain day of the month or phase of the moon, or at a fixed date. Easter is a movable feast, upon which all other movable feasts depend; Christmas is an immovable feast. In the Roman Catholic Church feasts are further divided into *obligatory* and *non-obligatory*, and again into *doubles, semi-doubles, simples*, etc., according to the religious offices required to be recited in the church service.

Double feast, an ecclesiastical festival on which the antiphon is doubled. See *semi-double* and *simple*. — **Feast of asses.** See *feast of fools*. — **Feast of Dolors.** See *dolor*. — **Feast of Eggs.** See *Egg Saturday*, under *egg*¹. — **Feast of fools** and **feast of asses,** festivals, simulating the Saturnalia, and perhaps a survival of them, celebrated in many countries of Europe, especially in France, during the middle ages, from Christmas to Epiphany, but chiefly on the 1st of January in each year. In the feast of fools a bishop, archbishop, or pope of fools was chosen and placed on a throne in the principal church, and a burlesque high mass was said by his orders. The feast of asses, following the former or celebrated on a later day, was a pageant that owed its name to the important part which the ass played in it. In some places the allusion was to the ass of Balaam, in others to the ass which is said to have stood beside the manger in which the infant Saviour was laid, or to the ass on which Mary and the child fled into Egypt, or, in others still, to the ass on which Jesus made his triumphal entry into Jerusalem. Some of the features of these festivals still survive in the carnival. — **Feast of lanterns,** a Chinese festival held annually at the first full moon of the year (the 15th day of the first month), when colored lanterns are hung at every door, and the graves are illuminated. — **Feast of Maccabees,** in the ancient Christian church, a festival celebrated annually in honor of the seven Maccabees, who died in defense of Jewish law. It is uncertain on what day the festival was held, but the Roman Catholic martyrology places it on the 1st of August. — **Feast of orthodoxy, of the federation, of the Sacred Heart, of the Presentation,** etc. See *orthodoxy, federation, heart*, etc. — **To make feast†,**

to show gladness; pay flattering attention; give friendly entertainment.

Chaucer, Death of Blanche, l. 638.

=**Syn. 2.** *Feast, Banquet, Festival.* The idea of a social meal of unusual richness or abundance, for the purposes of pleasure, may be common to these words. *Feast* is generic; specifically, it differs from *banquet* in the fact that at a *feast* the food is abundant and choice, while at a *banquet* there is richness or expensiveness, and especially pomp or ceremony. The essential characteristic of a *festival* is concurrence in the manifestation of joy, the joyous celebration of some event, feasting being a frequent but not necessary part: as, to hold high *festival*. See *carousal*[1].

When I make a *feast*,
I would my guests should praise it, not the cooks.
Sir J. Harington, Writers that carp, etc.

Go to your *banquet* then, but use delight
So as to rise still with an appetite.

They showed him also the jawbone with which Samson did such mighty *feats*. *Bunyan*, Pilgrim's Progress, p. 124.

=**Syn.** *Deed, Feat, Exploit, Achievement.* These words are arranged in the order of strength; *deed*, however, may have a much more elevated character than *feat*, and even surpass *exploit*. A *deed* may, on the other hand, be base or ignoble. It is, therefore, often accompanied by an adjective of quality. A *feat* is generally an act of remarkable skill or strength: as, the *feats* of a juggler, a ventriloquist, an athlete. An *exploit* is especially an act of boldness or bravery, with various degrees of mental power in working it out. An *achievement* is the result of large ability in planning, and diligence and boldness in executing. *Feat, exploit*, and *achievement* differ from *act, action*, and *deed* in that the first three always, and the last three only sometimes, represent something great.

Feathers are extremely modified scales. The nearest approach to them in animals other than birds is probably the quills of the porcupine. Feathers are epidermal, non-vascular, and non-nervous appendages, consisting of a horny and pithy substance, and subject to periodical molt. They grow somewhat like hairs, in a little pit or pouch formed by an inversion of the dermal layer of the integument, in a closed follicle, upon a peculiarly molded papilla, which causes the feather to assume its special shape. They are seldom implanted uniformly over the surface, but grow in special tracts or areas separated by naked spaces. (See *pteryla, apterium*.) All of a bird's feathers collectively considered constitute the *plumage* or *ptilosis*. (See cut under *bird*[1].) A perfect feather consists of a main stem, *shaft*, or *scape*; a supplementary stem, *aftershaft*, or *hyporachis*; and vanes, webs, or *vexilla*: these together making the *standard*. The scape is divided into two parts: one, nearest the body of the bird, is the *barrel, quill*, or *calamus*, a hard, horny, hollow, semi-transparent tube with one end inserted in the skin; it bears no webs, and passes insensibly at a point marked by a little pit (*umbilicus*) into the shaft proper or *rachis*. This is squarish in section, tapers to a fine point, is highly elastic, opaque, and solidly filled with dry pith; it bears the vexilla. The aftershaft is usually like a miniature of the main feather, springing from the stem of the latter at the junction of the calamus and rachis. (See *aftershaft*.) With its vanes it is called the *hypoptilum*. Sometimes it is as large as the main feather. There are two vanes, on opposite sides of the rachis. Each vane consists of a series of mutually appressed, thin, flat, linear or lancelinear plates, the *barbs*, set off obliquely from the rachis by their basal ends at a varying open angle. (See cut under *barb*[1].) To cause these plates to cohere with one another, and make a webbing of the vane, each barb bears secondary vanes; these are *barbules*, and bear to the barbs the same relation that the barbs bear to the rachis. Barbules are also fringed, as if frayed out, along their lower edges; each such fringe makes a tertiary vane. When these vanes are simple, they are termed *barbicels*; when hooked, *hooklets* or *hamuli*. (See cut under *barbule*.) From such perfect structure feathers may be reduced in various ways, even to lacking everything but the shaft; when this is very thick, feathers become much like scales, as in the penguin; when it is fine, they resemble hairs or bristles. In general, three types of feather-structure are recognized: (1) The perfectly feathery, *plumous* or *pennaceous*, structure. The goose-quill used as a pen is a good example (though it lacks an aftershaft). Most contour-feathers are pennaceous. (2) The downy or *plumulaceous*, such as makes up the under-plumage or down. (3) The *filoplumaceous*, which approaches a bristle or hair. (See cut under *filoplume*.) But there is no strict line of demarcation, and in fact most feathers are pennaceous with plumulaceous bases of the webs. Feathers are also classified as (1) *pennæ, plumæ*, or contour-feathers; (2) *plumulæ*, or down-feathers; (3) *semiplumæ*, or half-feathers; (4) *filoplumæ*, or thread-feathers; and (5) *pulviplumæ*, dust-feathers, or powder-down. (See phrases below.) The acquisition of feathers is called *endysis*; their loss, *ecdysis*. Birds which acquire feathers in the egg are *Præcoces* or *Ptilopædes*; those which are hatched naked are *Altrices, Psilopædes*, or *Gymnopædes*. Feathers are of extremely rapid growth. They are of many shapes, often remarkable, and of every possible color. The color is usually due to actual pigmentation, but in many cases to iridescence. The optical effect of iridescence is due to the texture of the webs. Among all epidermal structures, feathers probably combine in the highest degree the qualities of lightness, strength, and elasticity. They are also very warm, and in many cases water-proof.

A *federal* government is properly one in which the federal authority is independent of any of its component parts within the sphere of the federal action: distinguished from a *confederate* government, in which the states alone are sovereign, and which possesses no inherent power.

federalism (fed'e-ral-izm), *n.* [= F. *fédéralisme* = Sp. Pg. It. *federalismo*; as *federal* + *-ism*.] The doctrine or system of federation or federal union in government; the principle of assigning to the care of a central government such matters of common concernment as may be agreed upon, and all others to that of the governments of the federated states, provinces, or tribes; more specifically, the aggregate principles or doctrines of a federal party, as the Federalists of the United States. Federalism has been practised by many uncivilized races, as the ancient German tribes and some of the American Indians, chiefly for warlike purposes. It existed for certain civil purposes also among the Greeks and other ancient and medieval peoples, as in the English heptarchy, was more largely developed in the old German empire, and has since been adopted in many countries, especially republics. (See *federal*, *a.*, 2.) Its introduction into France was advocated by the Girondists after the fall of the monarchy.

We see every man that the Jacobins choose to apprehend taken up, . . . whether he be suspected of royalism or *federalism*, moderantism, democracy royal, or any other of the names of the faction which they start by the hour.
Burke, Policy of the Allies.

Intense Federalist as he was, his *Federalism* agreed with a stout anti-aristocratic spirit.
H. E. Scudder, Noah Webster, p. 46.

Stated broadly, so as to acquire somewhat the force of a universal proposition, the principle of *federalism* is just this: — that the people of a state shall have full and entire control of their own domestic affairs, which directly concern them only, and which they will naturally manage with more intelligence and with more zeal than any distinct governing body could possibly exercise; but that, as regards matters of common concern between a group of states, a decision shall in every case be reached, not by brutal warfare or by weary diplomacy, but by the systematic legislation of a central government which represents both states and people, and whose decisions can always be enforced, if necessary, by the combined physical power of all the states. *J. Fiske*, Amer. Pol. Ideas, p. 133.

The method by which *federalism* attempts to reconcile the apparently inconsistent claims of national sovereignty and of state sovereignty consists of the formation of a constitution under which the ordinary powers of sovereignty are elaborately divided between the common or national government and the separate States.
A. V. Dicey, Law of Const., p. 131.

federalist (fed'e-ral-ist), *n.* [= F. *fédéraliste* = Sp. Pg. It. *federalista*; as *federal* + *-ist*.] **1.** In *politics*, an advocate or a supporter of federalism, specifically, an advocate of a close union of states under a common government, or a supporter of such a union as against those who would weaken or destroy it; in *U. S. hist.* [*cap.*], a member of the Federal party. See *federal*, *a.*

And according to the degree of pleasure and pride we feel in being republicans ought to be our zeal in cherishing the spirit and supporting the character of *federalists*.
Madison, Federalist, No. x.

The *Federalists* were the only proper tories our politics have ever produced, whose conservatism truly represented an idea, and not a mere selfish interest — men who honestly distrusted democracy, and stood up for experience, or the tradition which they believed for such, against empiricism. *Lowell*, Study Windows, p. 105.

The party name of *Federalist* has since become historical; and yet, to speak logically, it was the Anti-Federal party that sustained a federal plan, while the *Federalist* contended for one more nearly national.
Schouler, Hist. U. S., I. 54.

See *feud*[2]. In this, which is its original sense, it implies the idea of reward for service or allegiance, and was used in contradistinction to estates in *allodium*, or entire property, which were generally small allotments held free of any obligation.

> The tenure of lands is altogether grounded on military laws, and held as a *fee* under princes.
> *Hooker*, Eccles. Polity, v. 80.

2. An estate of inheritance; an estate in land belonging to the owner and his heirs and assigns forever. In the latter case it is more specifically termed a *fee simple*. (See *conditional fee* (*b*), below.) The fee is the highest and most extensive interest that a person can have in lands. In this sense the king might have a fee, but not in the sense of def. 1. After the abolition of the feudal system the word continued to be used of real property; and although in the United States generally land is held in *allodium*, the private ownership, if subject to no paramount right except that of eminent domain vested in the State, is termed the *fee*. The word when unqualified may or may not mean an absolute or unqualified fee, or fee simple.

> Are Venus Damzels, all within her *fee*,
> But differing in honour and degree.
> *Spenser*, F. Q., VI. x. 21.

3. Estate in general; property; possession; ownership.

Base fee, a qualified fee; a freehold estate of inheritance to which a qualification is annexed, so that it must terminate whenever the qualification is at an end; more specifically, in the English law of settlements, the estate created by absolute alienation by a tenant in tail alone (see *entail*), which, being made without the consent of the protector, does not bar remaindermen or reversioners, but only the grantor's own issue, and hence is liable to be defeated by the failure of such issue.

> The curious kind of estate created by the conveyance in fee simple of a tenant in tail not in possession, without the concurrence of the owners of estates preceding his own, is called a *base fee*. *F. Pollock*, Land Laws, p. 108.

Conditional fee. (*a*) Any fee granted upon condition. (*b*) A fee limited to particular heirs or a particular class of heirs, under the common-law rule that, on the donee's once having such heirs, the estate became absolute for all purposes of alienation, on the ground that a condition once performed was at an end. (See *entail*.) To designate this kind of conditional fee at the common law, the more appropriate phrase is *fee simple conditional*. This evasion of the intent of donors to reserve a reversion on a failure of heirs was put an end to by a statute known as *De Donis*, which enacted that the will of the donor should be observed, and that on the failure of heirs the property should revert to the donor. The estate of the donee under this statute was termed a *fee tail*. See *tail*[2], *a.* (*c*) Later, the term *conditional fee* was applied to the estate of a mortgagee of land, under a mortgage in the usual form, which was regarded as vesting the fee in the mortgagee subject to its being divested by performance of the condition, namely payment.—**Determinable fee,** a fee determinable by a condition or a conditional limitation; more specifically, a fee created by a limitation to the grantee and his heirs till the happening of a future event which may or may not happen, as a gift to A and his heirs, and if A dies without issue, then to another.—**Fee simple, fee simple absolute,** a fee that is not qualified. See def. 2.—**Fee tail.** See *conditional fee* (*b*). **Great fee,** the holding of a tenant of the crown.

> By the feudal law, a *great fee* or great lordship, which are convertible terms, was the highest order of possession, and was held directly from the crown.
> *Baines*, Hist. Lancashire, II. 14.

In his demain as of fee. See *demain*.—**Limited fee,** a determinable fee; more specifically, a fee determinable by a conditional limitation.—**Plowman's fee,** peasant tenure; the custom by which lands descended to all the sons of the tenant in equal shares, with, however, some privilege or birthright in favor of the elder or younger son: a rule of descent which under the feudal system gave way to primogeniture.

> The strict English primogeniture as applied to the rustic holdings, sometimes called fiefs de roturier or "*ploughman's fee*." *Encyc. Brit.*, XIX. 735.

Qualified fee, a base fee; a freehold estate of inheritance to which a qualification is annexed, so that it must terminate whenever the qualification is at an end; more specifically, the estate created by a limitation to the grantee and the heirs of an ancestor of his in the paternal line whose heir he also is, as a gift to B and the heirs of A, his father.

To *be conscious* may be only the act of the understanding, apart even from reflection: as, to *be conscious of* the approach of danger; or it may rise to a high degree of frank admission: as, to *be conscious of* failure. Some of the organs in their sound condition have no organic *feelings.* *G. T. Ladd,* Physiol. Psychology, p. 513.

3. The immediate quality of what is present to consciousness in sensation, desire, or emotion, considered apart from all complication by thought; in a loose use, any content of consciousness not recognizable as thought or volition. The word (that is, its equivalent) was introduced into philosophy as an exact term in this sense by Tetens, a German Wolffian philosopher of the eighteenth century. Kant modified the meaning, for the convenience of his system, so as to restrict it as in def. 4, below.

The point which at present concerns us is simply that, when *feeling* is said to be the primordial element in consciousness, more is usually included under *feeling* than pure pleasure and pain, viz., some characteristic or quality by which one pleasurable or painful sensation is distinguishable from another. *J. Ward,* Encyc. Brit., XX. 40.

I have in this volume used *Feeling* as the name for the genus of which Sensation (with Muscular Feeling) and Emotion are the two species.
A. Bain, Emotions and Will, p. 615, App.

It cannot be too strongly urged in the face of mystical attempts, however learned, that there is not a landmark, not a length, not a point of the compass in real space which is not some one of our *feelings,* either experienced directly as a presentation or ideally suggested by another *feeling* which has come to serve as its sign.
W. James, Mind, XII. 208.

Feelings which correspond directly with an interaction between the organism and its environment are termed sensations; those which correspond indirectly are termed emotions; and when the remoteness from direct correspondence is great, the *feeling* is in some cases termed a sentiment. *C. Mercier,* Mind, IX. 335.

It may be needful to guard against a further misconception, and to state explicitly that the term *feeling,* the most general term in psychology, includes emotion, not less than sensation and perception.
G. H. Lewes, Probs. of Life and Mind, II. iv. § 17.

4. In a restricted sense, pleasure or pain; any state or element of consciousness having a pleasurable or a painful aspect.

As to the meaning of the term, it is plain that further definition is requisite for a word that may mean (*a*) a touch, as *feeling* of roughness; (*b*) an organic sensation, as *feeling* of hunger; (*c*) an emotion, as *feeling* of anger; (*d*) *feeling* proper, as pleasure or pain. But, even taking *feeling* in the last, its strict sense, it has been maintained that all the more complex forms of consciousness are resolvable into, or at least have been developed from, *feelings* of pleasure and pain. *J. Ward,* Encyc. Brit., XX. 40.

The *feeling,* the pleasurable or painful tone of the sensation, is always recognized as purely and simply a way in which the mind is affected.
G. T. Ladd, Physiol. Psychology, p. 504.

Hence—**5.** An emotion in so far as it is immediately present to consciousness, not having regard to the physiological disturbance which accompanies it; the capacity for emotion; mental state, disposition, or faculty as regards emotion; affective experience in general: as, a *feeling* of sympathy, a *feeling* of pride in the history of one's country. See *emotion,* 2.

Great persons had need to borrow other men's opinions to think themselves happy, for if they judge by their own *feeling,* they cannot find it. *Bacon,* Great Place (ed. 1887).

Nor, again, can we admit without verification the proposition which some philosophers, including Aristotle (and Plato in some passages), seem to assume a priori: that the kind of *feeling* which is most pleasant or preferable as *feeling* will always accompany the kind of activity which we approve. *H. Sidgwick,* Methods of Ethics, p. 162.

7. Obscure or vague perception; belief the reasons for which are not clearly understood: as, every one had a *feeling* of the truth of this statement.

felapton (fe-lap'ton), *n.* In *logic*, the mnemonic name of that mood of the third figure of syllogism which has both the premises universal and one of them negative. The following is an example: The loss of energy of a radiating mass of gas which gravitates to its own center is an emission of heat; but no loss of energy in such a mass of gas can tend to make the body cooler; hence, some emission of heat does not tend to make the radiating body cooler. According to some logicians, this reasoning is fallacious, because neither premise asserts that such a case actually occurs. The word *felapton* is one of the mnemonic names invented in the thirteenth century, and found in the "Summulæ" of Petrus Hispanus. The three vowels, *e*, *a*, *o*, indicate the quantity and quality of the three propositions, which are universal negative, universal affirmative, and particular negative, respectively. The letter *f* signifies that the mood is to be reduced to *ferio*, and the *p* that in the reduction the minor premise is to be converted per accidens.

feldspar (feld'spär), *n.* [A var. of *feldspath*, accom. to E. *spar*[2].] In *mineral.*, one of a very common group of closely related minerals, all silicates of aluminium and potassium or sodium or calcium, or, rarely, barium. They crystallize in the monoclinic or triclinic system with closely similar angles. The prismatic angle is not far from 120°, and they have two easy cleavages which make an angle of 90°, or nearly 90°, with each other. Their specific gravity lies between 2.6 and 2.8, and their hardness between 6 and 7. In color they vary from clear and glassy to white, grayish, and light shades of yellow, red, or green, rarely darker green to black. They occur in distinct crystals, also in massive forms varying in structure from coarsely cleavable to granular-crystalline, compact, and hornstone-like. They form an essential constituent of many of the common crystalline rocks, as granite, gneiss, syenite, diorite, most kinds of basalt, andesite, trachyte, etc. The monoclinic feldspars are orthoclase and hyalophane. The former is a potash feldspar (see *orthoclase*), and is the commonest of the group; the latter is a baryta feldspar, and is a rare species. Closely related to orthoclase is the triclinic microcline (which see), having the same composition, but varying slightly in form. Besides these there are the triclinic (lime-soda) feldspars, called in general *plagioclase*, because of the oblique angle between their two cleavages, and forming a series varying progressively in composition, form, optical characters, and specific gravity from the lime feldspar anorthite to the sodium feldspar albite; the intermediate species are considered as isomorphous compounds of these two extremes in varying proportions. Those ordinarily recognized are, named in order, labradorite, andesin, and oligoclase, the last approaching most closely to albite. The increase in soda in the members of the series is accompanied by an increase of silica, the species being increasingly acidic in the order named thus, anorthite contains 43 per cent. of silica, and albite 69 per cent. The specific gravity diminishes in the series from anorthite (2.75) to albite (2.61). Certain triclinic feldspars containing considerable potash and with an angle of cleavage varying but little from 90° are sometimes grouped under the name *anorthoclase*. °Common feldspar, or orthoclase (and microcline), is much used in the manufacture of porcelain; some kinds are employed for ornaments, as aventurin feldspar or sunstone, also moonstone (an opalescent variety of orthoclase, albite or oligoclase), and, most of all, the species labradorite, beautiful for its play of colors. Also *felspar*.—**Blue feldspar.** Same as *lazulite*.—**Glassy feldspar.** See *orthoclase*.—**Labrador feldspar.** Same as *labradorite*.—**Resplendent feldspar.** Same as *adularia* or *moonstone*.

This has been censured as an American pleonasm, like play-actor, inasmuch as good English usage has conferred this meaning on the word countryman alone. Still, the want of a more definite expression has been felt in England as well as in this country; and the term *fellow-countryman*, as distinguished from countryman, rustic, as the French compatriote and German landsmann are distinguished from paysan and landmann, has long been used in America, and in England has been adopted and sanctioned by such authorities as Southey and Lord Brougham. *Bartlett.*

5. (*a*) A station of privilege and emolument in English colleges which entitles the holder (called a *fellow*) to a share in their revenues. In Oxford and Cambridge the fellowships were either constituted by the original founders of the colleges to which they belong, or they have been since endowed. In almost all cases their holders must have taken at least the first degree of bachelor of arts, or of students in the civil law. Fellowships vary in value from about £30 to £250 a year and upward, and they all confer upon their holders the right to apartments in the college, and certain privileges as to commons or meals. Though many fellowships are tenable for life, in general they are forfeited upon attainment by the holder of a certain position in the church or at the bar, or upon his marriage. In this last case, however, a fellow may retain his fellowship by a special vote of the college. Except in the single case of Downing College, Cambridge, where graduates of Oxford and Cambridge are eligible, fellowships are confined to graduates of the university to which they belong. Many colleges now confer honorary fellowships to which no emoluments and no share in the government of the college are attached. (*b*) A scholarship or sum of money granted for one or more years to a graduate student to enable him to pursue his studies either at that college or university or abroad.

Antiq., 18, 9, § 3), who practised it in treaties, as constituting an inviolable pledge of fidelity.

Its constitution was long debated, it being variously considered as purely feldspathic, as a very fine intergrowth of the constituents of granite (*eurite*), or as in large degree composed of but partially individualized substance. The term is now used in a broader sense for a crypto- or microcrystalline mass composed largely of feldspar, with or without quartz, making up the ground-mass of many ★ igneous rocks. Some rocks are wholly of this character.

The property of felting results chiefly from the serrated or jagged structure of wool and most hairs, as well as from the crimped or wavy form natural to some animal fibers. The making of felt is thought to have originated at a very early date in the western part of Asia, and the best and most durable felt is still made in Persia and the neighboring countries. Felt floor-mats an inch or more thick and of admirable texture and printed in rich designs in color are used upon marble and tiled floors in Persia. (See *numud.*) In Europe, throughout the middle ages and later, felt was a usual material for hats, and was also used for stuffing or bombasting garments for both defense and fashion. Felt is now in general use not only for hats, but for clothing and upholstery, carpets, table-covers, and mats, jackets for steam-boilers, etc., and lining for roofs and walls. Broadcloth and other fulled woolen fabrics are partially felted by the process of fulling; and the familiar shrinkage of woolen garments in washing results from an unsought felting, which draws the fibers of the fabric closer together.

It is nailed down upon the roof in overlapping strips, and is usually coated subsequently with tar, or some special heavy pigment having tar or asphalt as a basis and commonly called *cement*.

aspera, along its posterior surface, bearing upon its upper extremity, by an oblique neck, a hemispherical head, and two trochanters, the greater and the lesser, and expanding below into two large condyles, the inner and the outer, both of which articulate with the tibia, but neither with the fibula. The slenderness of the bone is beyond an average for mammals, though in some it is still slenderer. Many femora, as of the horse, develop a third trochanter, and also may articulate with both bones of the leg. The reception of the head of the femur in the acetabulum is such that it articulates above with all three of the pelvic bones, the ilium, the ischium, and the pubis. In birds the greater trochanter abuts against the ilium, and thus enters into the formation of the hip-joint. See also cuts under *digitigrade*, *Dromæus*, and *Ichthyosauria*.

3. In *entom.*, the thigh; the third joint of the leg, between the trochanter and the shank or tibia. See cut under *corbiculum*.—**4†.** In *arch.*, the interstitial member between two channels in the triglyph of the Doric order.

This serpent infests sugar-plantations in the West India islands, and is dreaded alike by man and beast. The tail ends in a horny spine, which scrapes harshly against rough objects, but does not rattle. See cut under *Craspedocephalus.*

feriæ (fē'ri-ē), *n. pl.* [L.: see *ferie* and *fair*².] In *Rom. antiq.*, holidays during which free Romans suspended their political transactions and lawsuits, and slaves enjoyed a cessation of labor. The feriæ were thus *dies nefasti*. They were divided into two classes, *feriæ publicæ* and *feriæ privatæ*. The latter were observed by single families or individuals in commemoration of some particular event of consequence to themselves or their ancestors. *Feriæ publicæ* included all days on which public religious festivals were held, whether stated (*feriæ stativæ* or *statæ*) or occurring every year, but not on fixed days, the precise dates being appointed each time by the magistrates (*feriæ conceptivæ*), or ordered by the consuls, pretors, or dictator, with special reference to some particular emergency (*feriæ imperativæ*). The manner in which the public feriæ were kept bears great analogy to the modern observance of Sunday, the people visiting the temples of the gods and offering prayers and sacrifices.

See *barbara*.

ferison (fe-rī'son), *n.* The mnemonic name of that mood of the third figure of syllogism which has one of the premises particular and the other negative. The word is one of the names of moods invented in the thirteenth century and attributed to Petrus Hispanus. The three vowels, *e*, *i*, *o*, indicate the quantity and quality of the three propositions, namely, universal negative, particular affirmative, particular negative. The *f* shows that the mood is to be reduced to *ferio*, the *s* that the minor premise is simply converted in the reduction.

Fermatian (fėr-mā'shian), *a.* Pertaining to the French mathematician Pierre de Fermat (1601–65). — **Fermatian reasoning**, reasoning in the following form: "A certain character, P, if possessed by any one of a linear series of subjects, is necessarily possessed by the next following subject: now, the character P is possessed by the first subject of the series: ergo, it is possessed by all the subjects." The discovery of this form of reasoning by Fermat opened the theory of numbers to the researches of mathematicians. It holds good even if the series is infinite, so long as it contains no member which cannot be reached by proceeding by successive steps from the first member, as is the case, for example, with the entire class of finite positive integer numbers. In this particular Fermatian reasoning is contrasted, for example, with the syllogism of transposed quantity, which holds only for finite classes. On the other hand, the Fermatian inference fails in such a case as the following: If Achilles, pursuing a tortoise, is behind it at any instant, then he will still be behind it when he reaches the point where the tortoise now is; but he is behind it at first; therefore, he will always be behind it. The following is equally absurd: If any whole number is finite, the next greater whole number is finite; but 1 is finite; hence, all whole numbers are finite.

fermet†, *n.* An obsolete variant of *farm*¹.

ferment (fėr'ment), *n.* [= F. *ferment* = Sp. ★Pg. A gentle boiling, or the internal motion of the constituent parts of a fluid. [Rare.] — **2.** That which is capable of causing fermentation. Ferments are of two kinds, organized and unorganized. Organized ferments belong to the lowest order of microscopic fungi. (See *fermentation*.) Unorganized or chemical ferments are substances capable of causing chemical changes in certain other substances without themselves being permanently changed in the process: as diastase, maltin, and ptyalin,

which convert starch into a soluble modification or into sugar; pepsin, which dissolves proteids, forming peptones; emulsin, which resolves amygdalin into oil of bitter almonds, prussic acid, and dextrose.

★ **fermentation** (fėr-men-tā′shọn), *n.* [= F. *fermentation* = Sp. *fermentación* = Pg. *fermentação* = It. *fermentazione*, < L. as if **fermentatio(n-)*, < *fermentare*, ferment: see *ferment*.] **1†.** A gentle boiling or ebullition.—**2.** A decomposition produced in an organic substance by the physiological action of a living organism or by certain unorganized agents. See *ferment*. Fungi (and especially species of *Saccharomyces*) and bacteria are the agents of fermentative processes or changes. Fermentation naturally ceases when the nutritive elements of the fermented substance are exhausted, or a sufficient proportion of a substance (as alcohol) deleterious to the ferment-organism is produced. It may be checked or altogether prevented by anything which prevents the growth of the organism, as by exclusion of the germs or spores, by subjection to a temperature too high or too low, by the presence of too large a proportion of sugar or of a substance (called an antiseptic) which acts as a poison to the organism. There are various kinds of fermentation, each of which is caused by special organisms. *Alcoholic fermentation* in saccharine solutions, or fermentation in its most restricted sense, may be produced by any of several organisms, including several species of *Saccharomyces*, *Mucor*, *Penicillium*, and *Aspergillus*, and to a slight extent by certain other fungi; but the most important agent is *Saccharomyces cerevisiæ*, which produces the fermentation of beer. In fermenting wine, several species of fungi are found. *Mycoderma cerevisiæ* and *M. vini* cause destructive changes in wine and beer. *Acetous fermentation* takes place in liquids which have undergone alcoholic fermentation, and is caused by *Bacterium aceti*, *B. Pasteurianum*, and a number of other species of bacteria. The alcohol is oxidized, and acetic acid or vinegar is the result. The presence of these organisms in beer and other alcoholic beverages induces diseases of them causing their destruction. *Lactic fermentation*, or souring of milk, is induced by certain bacteria which decompose the sugar of milk and produce lactic acid. *Viscous fermentation* is of two kinds: the one is caused by certain bacteria which convert the fermenting substance into a slimy mass and produce mannite; the other is caused by *Leuconostoc mesenterioides*, which brings about the slimy condition, but does not produce mannite. The latter occurs in saccharine solutions, and is a source of serious loss to sugar-manufacturers on the European continent. The agent in *butyric fermentation* is *Bacillus amylobacter*, and butyric acid is the result. Certain fermentative changes are produced in wood by various fungi. *Putrefactive fermentation*, or putrefaction, occurs in animal substances and plant products containing a large proportion of nitrogenous matter. The organisms which are active in the putrefaction of beef have been grouped under the collective name of *Bacterium termo*. The ammoniacal fermentation of urine is caused by *Micrococcus ureæ*. See *putrefaction*, *bacterium*, and *germ theory*, under *germ*.

Fermentation is a very general phenomenon. It is life without air, or life without free oxygen, or, more generally still, it is the result of a chemical process accomplished on a fermentable substance.

3. Figuratively, the state of being in high activity or commotion; agitation; excitement, as of the intellect or feelings, a society, etc.

He [M. Schützenberger] thinks that this power, which he terms *fermentative* energy, may be estimated more correctly by the quantity of sugar decomposed by the unit-weight of yeast in unit-time.
Pasteur, Fermentation (trans.), p. 252.

2. Of the nature of, consisting in, or produced by fermentation.

It is not a *fermentative* process; for the solution begins at the surface, and proceeds towards the centre, contrary to the order in which fermentation acts and spreads.

a mortise in the steel breech-piece, and in the large calibers it is moved in and out by a translating screw on one side. The block is locked in position by a second screw having a part of its thread cut away so that a partial turn causes it to engage or disengage in the breech of the gun. The French or interrupted-screw fermeture is a steel screw with its exterior divided into sextants or arcs of 60° each. The screw-threads are removed from the alternate arcs, which thus present a plain cylindrical surface. The interior surface of the breech of the gun is similarly formed with alternate blank and threaded sectors. In closing, the threaded sectors on the block are brought opposite the blanks in the breech, and the block is inserted by turning a translating screw; then one sixth of a turn of the block to the right engages the threads on the block with those in the breech and closes the chamber. The De Bange or Freire gas-check is generally used with this system of fermeture. The fermeture of the Hotchkiss mountain-gun consists of a simple prismatic wedge, with a locking screw engaging in a recess in the breech. A handle on one side serves to close and draw out the block, and to lock it. This form of block has merely to support the head of the cartridge-case, which acts as its own gas-check. The fermetures for small-arms present a great variety of combinations and movements. The most important are the rotating breech-block, as in the United States Springfield and Martini-Henry rifles; the sliding breech-block, as in the Sharps and Winchester rifles; and the sliding bolt, as in the Hotchkiss and Chaffee-Reece rifles. In all modern small-arms the metallic cartridge-case serves as a gas-check or obturator. See *gas-check*, *interrupted screw* (under *screw*), *obturator*, and cut under *cannon*.

Some compare Skt. *parna*, wing, feather, leaf, tree (applied to various plants); the same connection of thought appearing in the Gr. πτερίς, a fern, πτερόν, a wing, feather, = E. *feather*.] One of a large group of vascular cryptogamous plants, constituting the natural order *Filicales*. They are herbaceous, rarely shrubby or arborescent plants, sometimes with long creeping rhizomes. But in many cases the rootstock or caudex is erect, when the species is called a *tree-fern*. The fructification, which is asexual, consists of spores produced in sporangia upon the backs or margins of the fronds. The sporangia in most genera are collected in definite clusters (sori), and these are usually covered by a special covering membrane, or one formed from the margin of the frond, called an *indusium*. For the technical characters see *Filicales*. In the largest family, the *Polypodiaceæ*, the sporangia are stalked and provided with a vertical, many-jointed ring, which ruptures at maturity, allowing the escape of the spores. In the other families the ring is less perfectly developed, or wanting. The spores in germination produce a green prothallium upon the surface of the soil, and upon the under surface of the prothallium antheridia and archegonia are monœciously produced. After fertilization the germ-cell of the archegonium develops into a frond-bearing plant. About 3,000 species of ferns are known. They are found all over the world, but abound in humid temperate and tropical regions. Great Britain has about 50, the United States and Canada about 225, India about 600. Ferns are very abundant as fossil plants. The earliest known forms occur in Devonian rocks and their remains are very common in connection with coal of the Carboniferous period. The *Ophioglossaceæ*, *Marsileaceæ*, and *Salviniaceæ* are now classed with the ferns.—**Christmas fern.** See *Christmas*.—**Cloak-fern,** any species of *Notholäna*.—**Filmy fern,** species of the genus *Hymenophyllum*, found on moist rocks and in copses.—**Flowering fern,** a fern of the genus *Osmunda*, especially *O. regalis*. To class an object as a *fetish* demands explicit statement that a spirit is considered as embodied in it or acting through it or communicating by it, or at least that the people it belongs to do habitually think this of such objects; or it must be shown that the object is treated as having personal consciousness and power, is talked with, worshipped, prayed to, sacrificed to, petted or ill-treated with reference to its past or future behaviour to its votaries. *E. B. Tylor*, Prim. Culture, II. 133.

The President de Brosses, a most original thinker of the last century, struck by the descriptions of the African worship of material and terrestrial objects, introduced the word *Fétichisme* as a general descriptive term; and since then it has obtained great currency by Comte's use of it to denote a general theory of primitive religion, in which external objects are regarded as animated by a life analogous to man's. . . . It seems to me . . . more convenient to use the word Animism for the doctrine of spirits in general, and to confine the word *Fetishism* to that subordinate department which it properly belongs to: namely, the doctrine of spirits embodied in, or attached to, or conveying influence through, certain material objects. *Fetishism* will be taken as including the worship of "stocks and stones," and thence it passes by an imperceptible gradation into Idolatry. *E. B. Tylor*, Prim. Culture, II. 132.

Fetichism is almost the opposite of Religion; it stands towards it in the same relation as Alchemy to Chemistry, or Astrology to Astronomy, and shows how fundamentally our idea of a deity differs from that which presents itself to the savage. The Negro does not hesitate to punish a refractory Fetish, and hides it in his waistcloth if he does not wish it to know what is going on. Aladdin's lamp is, in fact, a well-known illustration of a Fetish. *Sir J. Lubbock*, Orig. of Civilisation, p. 349.

A latent *fetishism*, which is betrayed in that love of personification, or of applying epithets derived from sentient beings to inanimate nature, . . . is the root of a great part of our opinions. *Lecky*, Europ. Morals, I. 372.

In *feudal law*, an estate in land granted on condition of services to be rendered to the grantor, in default of which the land was to revert to the grantor; a fief; a tenure of land under and by dependence on a superior. The grantor or lord was entitled to the homage or fealty of the grantee or vassal. The estate was so called in contradistinction to *allodium*, which is an estate subject to no superior but the general law of the land.

Palgrave considers that the origin of feudal tenure may be traced to the grants made by the Romans to the barbarian Laeti occupying the Limitanean or Ripuarian territories, upon the condition of performing military service. W. K. Sullivan, Introd. to O'Curry's Anc. Irish, p. ccxxiii.

2. Land held in feudal tenure by a vassal.

The essential and fundamental principle of a territorial *feud* was, that it was land held by a limited or conditional estate — the property being in the lord, the usufruct in the tenant.

The old *feudal* spirit which prompted a man to treat his tenants and villeins as part of his stock . . . had been crushed before the reign of Edward III. *Stubbs*, Const. Hist., § 469.

2. Pertaining to the state of society under this system of tenure; characteristic of the relations of lord and vassal.

It is time . . . that we had a *feudal* map of England before the manorial boundaries are wiped away. *Stubbs*, Medieval and Modern Hist., p. 64.

Feudal system, a system of political organization with reference to the tenure of land and to military service and allegiance prevalent in Europe in the middle ages. Its main peculiarity was that the bulk of the land was divided into feuds or fiefs, held by their owners on condition of the performance of certain duties, especially military services, to a superior lord, who, on default of such performance, could reclaim the land. This superior might be either the sovereign, or some subject who thus held of the sovereign, and in turn had created the fief by subinfeudation. According to the pure feudal system, the lord was entitled to the fealty of his tenants, but not to that of their subtenants, every man looking only to his immediate lord. On the continent of Europe, while the system was in full operation, this principle made the great lords practically independent of their nominal sovereigns, who could command their allegiance only through their self-interest or by superior force; and therefore kings were often powerless against their vassals. In England, however, the sovereign was always entitled to the fealty of all his subjects. Feudal tenures were abolished in England by act of Parliament in 1660, in Scotland in 1747, and in France at the revolution of 1789. In Germany, Austria, etc., they continued till after the revolutionary movements of 1848–50. In each case, however, they had long previously been much mitigated in their social and political effects. A feudal system prevailed in China from a very early period, but was brought to an end in 220 B. C., on the conquest of the whole country by Siang Wang of Tsin, known as Tsin-shi-Hwang-ti. The feudal system of Japan was abolished in 1871, when the daimios or barons surrendered their lands to the mikado. See *daimio.*

'a trembling,' akin to Gr. *φέβεσθαι*, flee affrighted, *φόβος*, flight, panic fear, fear, terror.] 1. In *pathol.*: (*a*) A temperature of the body higher than the normal temperature, appearing as a symptom of disease; pyrexia. The temperature of the body in health is between 98° and 99° F., and is maintained at this point by the adjustment of the production of bodily heat to its dissipation, both of these processes being largely under nervous control. During the period of invasion of a fever, or at any time when the temperature is rising, the heat produced exceeds the heat lost. If the rise is very rapid, the withdrawal of the blood from the skin, which diminishes the loss of heat, may give rise to a cold sensation or chill, which may be combined with an attack of shivering. The heat-producing mechanism has not been discovered. That it is, in part at least, under nervous control is shown by the occurrence of hysterical fever in which a sudden rise of temperature may take place without the presence of any evident lesion. The consumption of the tissues of the body in fever exceeds ordinarily the repair, and there is more or less emaciation; the excretion of urea is increased; the pulse is usually quickened as well as the respiration; the bowels are apt to be constipated; and thirst, loss of appetite, headache, and vague pains are commonly complained of. Fever is caused by zymotic poisons, by local inflammation, or by overheating as in sunstroke, and is sometimes of exclusively nervous origin. It is unquestionably injurious to the patient when it is excessive or too long continued; in some cases, where it does not exceed certain limits, it is very probably innocuous, or may even be advantageous. Fever would ordinarily be called slight up to 101° or 102° F., moderate up to 103° or 103.5°, and high above this. Temperatures above 105° F. would be called excessively high, and to such the name of *hyperpyrexia* is applied. The limits of the significations of these terms are not precisely marked; they vary somewhat in the usage of different individuals. The prognostic significance of pyrexia depends on the accompanying conditions. (*b*) The group of symptoms consisting of pyrexia and the symptoms usually associated with it. (*c*) A disease in which pyrexia is a prominent symptom: as, typhoid *fever*, scarlet *fever*, etc.

Our first positive knowledge of the manner in which the organism is incited to the morbid action that results in *fever* dates from the observation by Naunyn, Billroth, and Weber that a febrile elevation of the temperature may be experimentally produced by the introduction of septic matter into the circulation.

Typical cases, after an incubation of from five to eight days, with only slight prodromata, suddenly develop a high fever which lasts from five to seven days, and as suddenly disappears. With the high fever are associated malaise, anorexia, pains in the head, back, and limbs, muscular hyperalgesia, constipation or slight diarrhea, marked enlargement of the spleen, very frequent pulse, and a dirty-yellow complexion. The attack may recur after a week, and several such recurrences may take place. The mortality is from 2 to 4 per cent. After about one day the scarlet eruption appears, which lasts for three or four days in its original intensity, and then begins to fade out, when desquamation sets in. Among complications and consequences may be mentioned the formation of diphtheroid membranes in the throat, abscess of cervical lymphatic glands, inflammation of the ear, and acute inflammation of the kidneys. The contagion may preserve its vitality for months in clothes, bedding, carpets, etc. One attack usually protects against subsequent infection.—**Seasoning fever,** a mild form of fever which occurs in new-comers in the tropics.—**Septan fever,** intermittent fever in which the paroxysms recur on the seventh day (both paroxysmal days being counted).—**Septic fever,** the fever which arises from ill-cared-for wounds, from the infection of the system with their morbid products or the bacterial germs flourishing in them.—**Seven-day fever.** (*a*) Same as *septan fever.* (*b*) Relapsing fever.—**Seventeen-day fever,** relapsing fever.—**Sextan fever,** intermittent fever in which the paroxysms recur on the sixth day (both paroxysmal days being counted).—**Siam fever,** a name for yellow fever.—**Sierra Leone fever,** a form of remittent fever.—**Simple asthenic fever,** simple continued fever with debility.—**Simple continued fever,** a fever, usually mild, lasting from a few hours to a few days, independent of local inflammation, and neither in its features nor in the circumstances under which it arises disclosing its identity with other better-marked forms. Under the name are doubtless included in actual practice many mild and abortive cases of typhoid, malarial, and other fevers, some cases of purely neurotic origin, and possibly some dependent on a distinct unknown zymotic cause. Also called *synocha, synochus simplex, febricula, ephemera, ephemeral fever, sun-fever.*—**Slow nervous fever,** typhoid fever.—**Solar fever,** dengue.—**Spirillum fever,** relapsing fever.—**Splenic fever.** Same as *malignant anthrax* (which see, under *anthrax*).—**Spotted fever.** (*a*) Typhus fever. (2) A period of invasion of a week or less, characterized by a gradually increasing temperature, with morning remissions and evening exacerbations, want of appetite, thirst, dry and coated tongue, frequent pulse, headache, often nose-bleed, usually constipation, often slight diarrhea, slightly tympanitic abdomen, with perhaps some tenderness and gurgling in the right iliac region, some enlargement of the spleen, perhaps slight delirium at night, and some bronchitis. (3) A period of continued pyrexia (fever) in which the temperature ceases to rise, and in which its daily variations are less. This period (fastigium) lasts for a week or two. The want of appetite, thirst, dry tongue, frequent pulse, headache, and bronchitis continue or are increased. The tympanites, splenic enlargement, and delirium become more pronounced. Three or four soft yellow stools are passed daily. About the beginning of this period an eruption of small, pink, slightly raised spots appears on the skin, especially of the back and abdomen. (4) A period of defervescence, in which the fever gradually disappears and all the symptoms improve. This may last about a week. Cases vary much from this typical progress, and may be marked in addition by intestinal hemorrhage, perforation of the intestinal wall with collapse and peritonitis, thrombosis of the larger veins, especially the femoral, pneumonia, lobular and (rarely) lobar, or meningitis. Relapses (after a normal temperature has been reached) and recrudescences (before the fever has entirely disappeared) are not very uncommon. The mortality varies, but the average of recent reports is not far from 10 per cent. The main anatomical features are inflammation of Peyer's patches and of the solitary glands of the small and sometimes of the large intestine, with inflammation of the mesenteric lymphatic glands. A previous attack produces a certain but not complete protection. Protection is also secured by inoculation with cultures of typhoid bacilli which have been killed by heat. The contagium is given off from the sick mainly by the stools and urine. The contamination of food and drink, often through the agency of the house-fly, is the most important mode of ingress. Personal contact does not materially increase exposure. (See *carrier,* 1.) Typhoid fever is caused by a bacillus, in length about one third the diameter of a red blood-corpuscle, in thickness about one third of its length, with rounded ends, mobile, forming spores at a temperature between 30° and 42° C., but not at lower temperatures, and forming minute brownish-yellow colonies on gelatin, which it does not soften. For synonyms, see phrases above (*enteric, intestinal,* etc.).—**Typhomalarial fever,** a term formerly applied to a supposed disease resulting from the action of the typhoid and malarial poisons.—**Typhus fever,** a contagious fever which in typical cases presents the following features: A period of incubation of nine days or more, a sudden onset of fever, often with a chill, a period of continued fever with pains in the head, back, and limbs, dizziness, noise in the ears, frequently bronchitis, and enlarged spleen. An eruption appears on the third to the seventh day, in the form of small red spots, usually abundant over the trunk and limbs, which in two or three days more become hemorrhagic. In the second or third week the disease may terminate by a fall of temperature, which is usually quite rapid. The mortality varies from 6 to 20 per cent. The most susceptible years are between the ages of twenty and forty. The disease occurs only where there is overcrowding and neglect of sanitary precautions. Second attacks are rare.—**Urethral fever,** fever ensuing on an operation on the urethra, such as passing a catheter.—**Yellow fever,** an infectious disease of warm climates, typical cases of which present the following features: After a period of incubation varying from a day to several weeks, the invasion begins suddenly with headache, pains in back and limbs, often distinct chill, nausea, often vomiting, inactive bowels, fever (pyrexia) usually high, a pulse-rate less than corresponds to the pyrexia, sometimes vertigo, convulsions, delirium, and albuminuria. Following upon these symptoms, often after a lull and apparent beginning of recovery, may come exhaustion of the heart and nervous centers, bleeding from mucous membranes (giving rise to black vomit), jaundice, scanty urine, and albuminuria. The mortality in the better class of private cases varies in the experience of different observers from 7 to 10 per cent. The autopsy reveals, in addition to the hemorrhages, congestion of the nervous centers, hypostatic congestion of the lungs, fatty degeneration of the heart and liver, and parenchymatous nephritis. The infectious principle of the disease has not been definitely determined, but it is believed to be a very minute protozoan parasite of the red blood-corpuscles. The infection is carried from the sick to the well by a mosquito of the genus *Stegomyia,* and it is thought that the parasite passes through one cycle of its development in the body of this insect. Most authorities no longer believe that the disease can be spread through the medium of clothes and other goods, except as pockets of these may confine infected mosquitos. Whites are more susceptible to the disease than blacks, new-comers than old inhabitants. A previous attack usually produces immunity. Geographically it occurs in the warmer parts of America and in some parts of the old world.—**Yellow remittent fever,** ardent continued fever. In *anat.*, the outer one of two bones which in most vertebrates (above fishes) extend from the knee to the ankle: so called because in man the bone is very slender, like a clasp or splint applied alongside the tibia. When a fibula is complete, as it usually is, it extends the whole length of the tibia, its foot entering into the composition of the ankle-joint. When reduced, it is usually shortened from below, so that it does not reach the ankle, lying along a part of the tibia, and very frequently ankylosed with it; or it may be of full length and ankylosed above and below with the tibia, as in many rodents. The human fibula is a slender straight bone, as long as and separate from the tibia, and clubbed at both ends; the upper end is articulated with the tuberosity of the tibia, and excluded from the knee-joint; the lower end is connected with the tibia, and also articulated with the astragalus, thus entering into the ankle-joint, and forming the outer malleolus, or bony protuberance on the outer side of the ankle. Nine muscles are attached to this bone in man. See also cuts under *Dromæus*, *Ichthyosauria*, and *tibiotarsus*.

(*c*) In a wide sense, not now current, any literary product of the imagination, whether in prose or verse, or in a narrative or dramatic form, or such works collectively.—**5.** In *law*, the intentional assuming as a fact of what is not such (the truth of the matter not being considered), for the purpose of administering justice without contravening settled rules or making apparent exceptions; a legal device for reforming or extending the application of the law without appearing to alter the law itself. Inasmuch as the courts cannot alter the law, but only declare it and apply it to facts ascertained by them, it was early discovered that the only way in which they could adapt the law to hard cases, or stretch it to new cases, was by pretending a state of facts to fit the rule of law it was thought just to apply. Thus it was a rule of law that a deed takes effect from delivery, and the courts had no power to alter this rule; but if a grantor fraudulently or negligently delayed delivering his deed at the time it bore date, and afterward sought to claim some unjust advantage, as having continued to be owner meanwhile, the courts, not being able to change the rule of law, would by a fiction treat the delivery as relating back to the date. So, when legislation forbade transfers of land unless made publicly by record, the courts allowed an intending grantee to sue, alleging that the land belonged to him, and the intending grantor to suffer judgment to pass; thus by a fiction creating a mode of conveyance which, for all practical purposes, preserved the privacy of titles. Direct methods of improving the rules and forms of law have in recent times superseded the invention, and for the most part the use, of fictions.

I employ the expression "Legal *Fiction*" to signify any assumption which conceals, or affects to conceal, the fact that a rule of law has undergone alteration, its letter remaining unchanged, its operations being modified.
Maine, Ancient Law, p. 26.

Ficus (fī'kus), *n.* [L., a fig-tree, a fig: see *fig*[2].] **1.** In *bot.*, a very large genus of tropical and subtropical trees or shrubs, belonging to the family *Moraceæ*, characterized by bearing their minute unisexual flowers within a nearly closed globose or pear-shaped receptacle. The genus is remarkable for the peculiar arrangement by which cross-fertilization is effected through the agency of insects. There are always three forms of flowers, the staminate, the pistillate, and a third, the gall-flower, which resembles the pistillate but is incapable of fertilization, and is usually occupied by the pupa of a species of *Blastophaga* or other hymenopterous insect. In a large group of species the three forms are found within the same receptacle; but in much the larger number, as in the common fig, the female flowers are in one receptacle and the male and gall flowers together in another. The perfect insect is formed synchronously with the maturity of the pollen of the male flowers, through which it makes its way and escapes by a perforation made at the apex of the receptacle. In what way it conveys the pollen to the pistillate flowers in the closed female receptacle is not understood, but it is believed that it is done and that by this means only the female flowers are fertilized. Generally the barren and fertile receptacles are upon the same tree and are similar in appearance, but in the common fig they are upon separate trees, and differ so much in form that the sterile, known as the wild fig or caprifig, was once considered by many botanists as a species distinct from the other. There are about 600 species, the greater number belonging to the islands of the Indian and Pacific oceans, though there are many in tropical America. Three species are found in the southern United States. The genus includes the common fig (*F. Carica*), the banian (*F. Bengalensis*), the india-rubber tree (*F. elastica*), etc. The wood is generally soft and valueless. See *fig*[2], and cut under *banian.*

II. *n.* 1. The quotient of unity divided by five; one of five equal parts of anything: as, one *fifth* ($\frac{1}{5}$) of an acre.—2. In *music:* (*a*) A tone five diatonic degrees above or below any given tone. (*b*) The interval between any tone and a tone five degrees distant from it. (*c*) The combination of two tones distant by a fifth. (*d*) In a scale, the fifth tone from the bottom; the dominant: solmizated sol, as G in the scale of C, or E in that of A. The typical interval of the fifth is that between the first and fifth tones of a diatonic scale, acoustically represented by the ratio 3:2, and equal to three diatonic steps and a half. Such a fifth is called *perfect* or *major;* a fifth a half-step shorter is called *diminished* or *minor;* a fifth a half-step longer is called *augmented*, *pluperfect*, *superfluous*, or *extreme*. The perfect fifth is the next most perfect consonance after the octave. In harmony the parallel motion of two voices in perfect fifths is forbidden; such fifths are often called *consecutive fifths*, or simply *consecutives*.

As if a musician should insist on having nothing but perfect chords and simple melodies, no diminished *fifths*, no flat sevenths, no flourishes, on any account.
O. W. Holmes, Autocrat, ii.

3. (See fig. 1.) The objection to this kind of progression becomes evident when the intermediate tones through which the skipping voice virtually passes are filled in. (See fig. 2.) Hidden fifths are forbidden in strict counterpoint, and discountenanced in simple harmony, particularly if both voices skip. Compare *hidden octaves*.

Carica*, is a native of the Mediterranean region; it has been cultivated from a very remote date, and is now found in most warm temperate countries. It is a small tree, with large, rough, deciduous leaves, and a pyriform fruit, which varies much in size, color, and flavor, and of which two crops are usually borne each season. This fruit consists of a hollow, fleshy receptacle filled with a multitude of minute nutlets or so-called seeds, the ripened ovaries of the pistillate flowers which covered the interior. When green the fig has a milky, acrid juice, which becomes sweet and mucilaginous at maturity. The Turkey or Smyrna figs of commerce, which are the most esteemed, are large and pulpy. A superior quality of these are known as *eleme figs* (Turkish *ellémé*, hand-picked). What are called Greek figs are small and dry. The number of cultivated varieties is large. Figs are used in medicine as a mild laxative. The wild fig, or caprifig, is the staminate and sterile form of the same species. Of other species, *F. Sycomorus*, Pharaoh's fig, or the sycamore fig, is a large tree of Egypt, the fruit of which is eaten by the Arabs. Its light, durable wood was used by the Egyptians as the material for their mummy-cases. *F. religiosa*, the sacred fig of India, is also known as the *pippul-* or *bo-tree* (which see). *F. lævigata* is the wild or red fig of southern Florida and the West Indies, a tree sometimes 40 feet high, and spreading by aërial roots, with a very small, globose fruit. The black fig of Jamaica is *F. laurifolia* and *F. crassinervia*. In Australia, *F. macrophylla* is known as the Moreton Bay fig, a noble tree with a broadly buttressed trunk. *F. rubiginosa*, the Port Jackson fig, is a tree with rooting branches, similar to the banian.

I, by this *figure-caster*, must be imagined in such distress as to sue to Maronilla.
Milton, Apology for Smectymnuus.

figure-casting (fig′ūr-kȧs″ting), *n.* The art of preparing casts of human or animal forms and of various other complex objects. A figure is first accurately formed in wax, clay, plaster, or other suitable material, which serves as the core. If the core is fusible, or can be reduced to ashes, the mold is formed directly upon the core, and when it is perfectly dry and hard it is exposed to a heat sufficient to melt or incinerate the core, the removal of which leaves a cavity for the metal of the cast. This method gives a solid casting, and is therefore suitable for small work only; moreover, the model itself is destroyed by one use. Exquisite casts of natural objects are made in this manner. If the core cannot be removed in the way mentioned, the mold itself is made in parts to permit its removal.

When no figure is used, the head is often finished off as a *scroll-head* or a *fiddle-head* (see these terms), which are not strictly figureheads.

Tanagra figurine, in *archæol.*, one of the small terra-cotta figures of divinities, of mortals, or of animals, found in various quantity and perfection throughout Greek lands, These figures were in great demand among the Greeks as household ornaments, and it was usual to present them as offerings in temples, and to bury several of them with a dead body. They were, as a rule, cast in molds and then finished, often very delicately, by hand, and after the baking they were brilliantly colored. In them is preserved a charming memorial of Greek private life in its various phases, such as the games of the children and the occupations of the women. They are commonly known as *Tanagra figurines*, because those first brought into public notice, as well as some of the most beautiful examples since found, come from the cemetery of Tanagra in Bœotia.

'small kilt' (*beag*, small, little), in distinction from *feileadh-mor*, the 'large kilt' (*mor*, large, great), the kilt in its primitive form, consisting of one piece, generally of tartan, covering, when spread, the whole body, and girt around the waist; *feileadh*, *feile*, the kilt, cf. *filleadh*, a fold, plait, < *fill*, v., fold.] A plaited petticoat or skirt reaching only to the knees, worn by men in the Highlands of Scotland; a kilt.

filibuster (fil'i-bus-tėr), *n.* [< Sp. *filibustero* (with inserted *i* in first syllable) (= It. *filibustiere*), < F. *flibustier*, earlier *fribustier*, a filibuster, bucaneer, freebooter (with *s* inserted, but orig. not pronounced—a common fact in 17th century F., after the analogy of words in which an original *s* was retained in spelling, though it had become silent in pronunciation); < D. *vrijbueter* (Kilian, 1598), now *vrijbuiter*, a freebooter, = E. *freebooter* = Dan. *fribytter* = Sw. *fribytare* = G. *freibeuter* (the E., Dan., Sw., and G. words being not independent formations, but formed after the analogy of the D. *vrijbueter*, which appears to be the oldest form). In a Dutch work ("De Americaensche Zee-Roovers," 1678) written by a bucaneer named John Oexmelin, otherwise Exquemelin or Esquemeling, and translated into French and Spanish, and subsequently into English (1684), the adventurers of the West Indies are said to have been divided into three classes—the bucaneers (*boucaniers*) or hunters (see *bucaneer*), the filibusters (*flibustiers*) or rovers, and the farmers (*habitans*); and the *flibustiers* are said to have assumed their name "from the English word *flibuster*, which means rover"; this must refer to E. *freebooter*, but the D. form appears to be the original. The bucaneers consisted mainly of French, Dutch, and English adventurers, and not to any extent of Spaniards, with whom they were constantly at war; the Sp. form *filibustero* can only be an accom. of the F. *flibustier*; the *s* is now pronounced in F., etc., because, as now used, it is taken from the books, as spelled. The commonly assumed connection with E. *flyboat* (Sp. *flibote*, *filibote*, F. *flibot*, < D. *vlieboot*: see *flyboat*) has no support either in form or in historical fact.] 1. A freebooter: in history, a name distinctively applied to the West

★**filter**[1] (fil'tėr), *n.* [= D. Dan. Sw. *filter*, < F. *filtre*, a filter, OF. *feutre*, felt, a filter, F. *feutre*, felt,

= Sp. Pg. *filtro* = It. *feltro*, felt, < ML. *feltrum*, *filtrum*, felt: see *felt*[1], and cf. *felter, v.*, *feuter*.]

1. A device for arresting and separating any matter mechanically suspended in a liquid. Filters used in the processes of analytical chemistry are made of paper or asbestos. The filter-paper is bibulous, consisting of nearly pure cellulose, with only bare traces of mineral matter. Many precipitates are more conveniently separated by an asbestos filter, the most common form consisting of an ordinary platinum crucible having the bottom perforated with fine holes which are covered with a thin asbestos felt. In the arts filters are used to purify water, syrups, vinegar, the juices of cane and fruits, oils, liquors, sewage, liquid by-products, and molten metals. The materials used in filtration are gravel, sand, charcoal, bone-black, sponge, fabrics, woven wire netting, asbestos, porous brick and stone, mineral wool, rope, paper, and powdered glass. The devices used to hold the straining material are in a great variety of forms, from a simple wick or loose cloth hung over the edge of a bowl of water and acting as a capillary strainer, to a settling-pond filtering 400,000 gallons of water in a day. The most common filter is a cone of bibulous paper, or a square of cloth sewed together to form a bag (called *Hippocrates's sleeve*). Filters also consist of porous brick or stone partitions, as in a cistern, or vessels partly filled with sand and gravel, or tubes filled with sponge, charcoal, or sand, etc. Domestic filters are used in connection with pumps and water-faucets. To cause the liquid to pass through a filter, the weight of a column of water, the pressure of the atmosphere, mechanical force from a screw or from steam-pressure, and centrifugal force are employed, as in the *centrifugal filter*, *oil-filter*, *vacuum-filter*, and many forms of pressure-filters. Filters are also made reversible and intermittent, so that the filtering material may be freed from the collected sediment. In some pressure-filters the liquid or syrup is within a cylinder, and is forced outward through rings of fabric under steam-pressure; in others it is forced through a series of strainers piled one above another. Where bone-black and charcoal are used, there is also a filtering or straining of a certain amount of gas and organic material that would pass through any other filter without detention. Filters are also used to remove dust and floating matter from air, but such devices are more properly termed *air-strainers*.

Having for trial-sake filtered it through cap-paper, there remained in the *filtre* a powder of a very deep and lovely colour. *Boyle*, Works, I. 365.

fin[1] (fin), *n.* [< ME. *finne*, *fynne*, < AS. *finn* = MD. *vinne*, D. *vin* = LG. *finne* (> G. *finne*) = OSw. *fina*, Sw. *finne*, *fena* = Dan. *finne*, fin, = L. *pinna*, fin. L. *pinna*, a fin, is rare; it is usually regarded as identical with *pinna* or *penna* (orig. different words, but used indiscriminately), a feather, wing, a feather on an arrow, an arrow, LL. *penna*, a pen, etc. The form *penna* was in OL. *pesna*, *petna*, the same, though with different suffix, as E. *feather*, q. v. See *pen*[2] and *pin*[1].] 1. An extension from the body of an aquatic animal, which serves for propelling, steering, or balancing in the water, and is developed from various parts of the body, generally as an alate or wing-like organ; a pinna. (*a*) In fishes there are unpaired or vertical and paired or horizontal fins. The former are dorsal, anal, or caudal. The paired fins are pectoral and ventral, the former homologous with the anterior member or manus (hand) of terrestrial vertebrates, the latter homologous with the posterior member or pes (foot). The relations of the spinous and soft portions of the dorsal and anal fins, and the position and structure of the ventral fins, as well as various other modifications of all the fins, have been much utilized for the classification and discrimination of groups in ichthyology. The names of the fins are commonly abbreviated A., C., D., P., V., as in the accompanying figure. In the lower fishes the fins are sustained in an erect position by numerous filamentary or slender rods (actinotrichia), but in the typical fishes there is a growing together of the actinotrichia into special rays or spines. In various forms (*Nematognathi*, *Salmonidæ*, etc.) there is likewise a pocket-like sac or ridge on the hinder part of the back, generally consisting of adipose matter and called an adipose fin. (*b*) In cetaceans and sirenians the caudal and (if present) the dorsal fins are simply extensions of integument and soft tissues without any skeletal framework, while the pectorals are homologous with the anterior limbs of quadrupeds, having the same bones concealed in the outgrown integument; but there are no outward indications of hind limbs as fins. (*c*) In seals and other aquatic carnivorous mammals the fore and hind limbs, more or less involved in the common integument, constitute fins or flippers. (*d*) In various aquatic reptiles there are fins like those of cetaceans, being either tegumentous expansions or pectoral limbs, or both; and pelvic limbs are also often present in the form of fins. (*e*) In aquatic batrachians, adult or larval, the tail is usually a fin, as that of the tadpole. (*f*) In birds the reduced and peculiarly modified wings of penguins constitute fins. (*g*) In numberless invertebrates some extended or expanded part or organ of the body, of no determinate homology, serves as a swimming-organ, and so constitutes a fin, as the expansion of the foot of a pteropod. See *pinna*, *flipper*.

(*c*) Determining completely the rights of the parties, so that no further decision upon the merits of the issues is necessary: as, a *final* judgment or decree—that is, one that is ready for execution, or for review by an appellate court, as distinguished from an interlocutory judgment or decree, or one that is preliminary to a further hearing and decision on details, before its execution or review by appeal.—**Final close**, in *music*, a concluding cadence.—**Final diameter.** See *tactical diameter*, under *diameter*.—**For final**†, finally. *Chaucer.*—**Syn.** *Final*, *Eventual*, *Ultimate*, *Conclusive*. *Final*, coming at the end or at last, marks mainly the circumstance of being the last or at the last. *Eventual* has reference rather more to the outcome of events. *Ultimate* is like *eventual* in that respect: an *ultimate* object is that to which all one's actions tend as their aim and crowning point; in this sense it is a sort of superlative, with *ulterior* as the corresponding comparative. *Conclusive*, like *decisive*, is active; it means *final* by closing or settling, putting a stop to any further question or procedure: as, a *conclusive* argument, step, decision.

★ **finite** (fī'nīt), *a.* and *n.* [= F. *fini* = Sp. Pg. It. *finito*, < L. *finitus*, pp. of *finire*, end, complete, finish: see *finish.* Cf. *fine*[2], *a.*, ult. a doublet of *finite.*] **I.** *a.* 1. Not too great nor too small to be naturally susceptible of measurement, whether measurable by us or not; not infinite nor infinitesimal. All objects of ordinary experience are finite; God, eternity, immensity, and the like are not finite. Etymologically, *finite* means having an end or terminal; but this signification is not coextensive with the English use of the term. Thus, the circumference of a circle has no ends, yet is finite; while past time has an end, yet is not finite. So, if a finite arc be cut out of a parabola, what remains has two ends, yet is not finite.

The obvious portions of extension that affect our senses carry with them into the mind the idea of *finite;* and the ordinary periods of succession whereby we measure time and duration, as hours, days, and years, are bounded lengths. *Locke*, Human Understanding, II. xvii. 2.

The following are the special significations of the word: (*a*) As applied to a class or integer number, capable of being completely counted: this is the fundamental meaning. This distinction between a finite and an infinite class is very important, because there is a peculiar mode of reasoning, called by logicians reasoning by transposed quantity, which is applicable to finite classes alone. The following syllogism is an example: "Every Hottentot kills a Hottentot; but no Hottentot is killed by more than one Hottentot; hence, every Hottentot is killed by a Hottentot." If by the Hottentots is here meant a class of which a complete census might be taken, this conclusion must be true, provided the premises are true. But if the generations of Hottentots are everlasting, each Hottentot might kill another, and yet some Hottentots might die natural deaths. Reasoning by transposed quantity is indispensable in the higher arithmetic and algebra; and consequently in these branches of mathematics the distinction between finite and infinite classes is very important. (*b*) As applied to continuous quantity, smaller than a suitably chosen finite number multiplied into the unit of measurement, and larger than a suitably chosen finite number multiplied by the unit of measurement.

On account of the *finite* speed of light, each star appears to describe in space a circle of fixed magnitude, in a plane parallel to that of the ecliptic. *Tait*, Light, § 66.

See *canon*[1].—**Finite existence**, the mode of existence of everything except God; existence in the ordinary sense, not transcending our power to imagine it; contingent existence.—**Finite term.** (*a*) In *logic*, a noun or verb not contain-

ing a negative particle, as *man*, opposed to *not-man*; also, a proposition containing only finite terms. (*b*) In *math.*, an integral is said to be expressed in *finite terms* when it is expressed without resort to an infinite series, although it may be expressed by means of exponential, elliptic, or Abelian functions which are synonymous with infinite series; but frequently expressions involving higher kinds of functions than the exponential and trigonometric are excluded.

II. *n.* That which is finite; finite things collectively: used only with the definite article.

When one talks of the infinite in terms borrowed from *the finite* . . . his words are not symbols.

2. An engine designed to throw a continuous stream of water through a hose upon a conflagration, for the purpose of extinguishing it.

Fire-engine.

Fire-engines are of three principal kinds: *hand-power*, *steam*, and *chemical*, according to the power employed. Hand-power fire-engines consist in the main of a pair of single-acting force-pumps, mounted on wheels, and worked by hand. They have been generally superseded by the application of steam. Steam fire-engines consist essentially of a pair of single-acting suction- and force-pumps operated by steam, the whole apparatus being mounted on wheels and drawn by horses, or sometimes self-propelled. The chemical fire-engine is a large form of fire-extinguisher mounted on wheels and drawn by horses. Floating fire-boats and steam fire-engines are used in large ports, for the protection of shipping and the water-fronts.

fire-escape (fīr′es-kāp″), *n.* Any apparatus or structure designed to enable persons to escape from the upper windows of a building in case of fire. Portable fire-escapes consist generally of ladders, often mounted on wheels for ease in transportation, and capable of being extended like a telescope; permanent fire-escapes consist usually of light iron ladders and landings attached to the outside of a building.

fire-extinguisher (fīr′eks-ting″gwish-ėr), *n.* An apparatus designed for immediate and temporary use in putting out a conflagration by means of a small stream of water or of water mingled with carbonic-acid gas. In the commonest form water is placed in a metal holder or vessel, and above it, within the holder, is placed a smaller vessel containing a chemical, as sulphuric acid, that may be set free by the turning of a handle or screw on the outside of the apparatus. Another chemical, commonly sodium bicarbonate, is also placed in the apparatus. When the acid is set free it combines with the sodium, setting free carbonic-acid gas, which, by its pressure, escapes when a nozle is opened, carrying the water with it in a strong stream. Such extinguishers are usually made portable, to be carried in the hand or upon the back, or are mounted upon a light truck to be drawn by a horse; but they are also made in heavier forms, when they are commonly called *chemical fire-engines*.

Its larva lives in the ground, feeding on earthworms and soft-bodied insects, and transforms to the pupa in an oval earthen cell in June, issuing as a beetle ten days later. In the genus *Photuris* the larva is luminous. The larger tropical fireflies belong to the elaterid genus *Pyrophorus*, and are known as *cucujids*. One of the most brilliant is *P. noctilucus* of South America and the West Indies, emitting such luminosity from two eye-like fe-

The fireplace-cavity being much wider than the flue, they are joined by a tapering portion, at the narrowest part of which there is often a damper for regulating the draft. The fuel is burned on andirons or, if coal, in an iron receptacle or *grate*.

The *fireplaces* were of a truly patriarchal magnitude, where the whole family, old and young, master and servant, black and white, nay, even the very cat and dog, enjoyed a community of privilege, and had each a right to a corner. *Irving*, Knickerbocker, p. 168.

fire-proof (fīr′prōf), *a.* Proof against fire; so constructed or protected as to be incombustible. Buildings are rendered fire-proof by the exclusive use in their construction of non-combustible materials, as stone, brick, iron, cement, concrete, and asbestos. In the case of textile fabrics, as cotton and linen, the means adopted is saturation with various salts, as borax, which leave their crystals in the substance of the fabric. Wood is best protected by silicate of soda, which on the application of strong heat fuses into a glass, and, not only enveloping the outside, but also filling the internal pores of the wood, shields it from contact with the oxygen of the air. All that can be done to protect combustible materials by any process, however, is the prevention of conflagration; no process yet known can prevent smoldering.

fireproof (fīr′prōf), *v. t.* [< *fire-proof*, *a.*] To render proof against fire by some protecting cover, by chemical treatment, or by construction with incombustible materials.

fire-regulator (fīr′reg″ū-lā-tor), *n.* An automatic device employed with steam-boilers to maintain a uniform pressure. It consists essentially of a piston or diaphragm which opens when the steam reaches a certain pressure, lifting a weighted lever which in turn controls a damper in the chimney. The closing of the damper checks the fire, when the pressure falls and the damper opens again, the process being continually repeated, and thus maintaining the pressure within certain limits. Usually called a *damper-regulator.*

fire-shield (fīr′shēld), *n.* A sheet-metal guard used to protect workmen at a furnace or firemen at a fire from the heat. In an improved form two sheets of corrugated iron are riveted together at the edges, and connected at the top with a hose bringing water under pressure. The water fills the screen and escapes below. Hung on an elevated track before a furnace-door or suspended from a crane, it serves to absorb the heat from the furnace, and to keep the fire-room cool. When not required, it is rolled aside or lifted by the crane.

fire-ship (fīr′ship), *n.* A vessel freighted with combustibles and explosives and set adrift, for the purpose of burning or blowing up an enemy's ships, a bridge, or other object.

2. A contrivance of inflammable and explosive materials combined in various proportions, for the purpose of producing in combustion beautiful or amusing scenic effects, or to be used as a night signal on land or sea, or for various purposes in war: commonly used in the plural. The basis of these compositions consists of potassium chlorate, niter, sulphur, and charcoal, pulverized, and combined in different proportions with other agents which have the quality of imparting color to the flame (as with copper sulphate for blue, strontium nitrate or carbonate for red, potassium salts for violet, sodium salts for yellow, barium carbonate or nitrate for green), and with iron- and steel-filings to produce brilliant scintillations. These compositions are packed in cases of paper and pasteboard, generally cylindrical, the processes of packing and finishing demanding much skill and care. For scenic displays, the forms of fireworks most in use are the *fixed fires*, such as theater-fires, lances, and gerbes; *rotating fires*, as pin- or catharine-wheels, spiral wheels, etc.; *ascending fires*, as sky-rockets and girandoles; Roman candles; etc. As night signals or as incendiary projectiles, various pyrotechnic devices have been employed with success in military and naval operations. These devices consist of preparations used (1) in the service of cannon or cannon-ammunition, such as slow-match, quick-match, friction, electric, and obturating primers, port-fires, and fuses; (2) for signals, such as signal-rockets, signal-lights, blue lights, etc., with their decorations consisting of stars, serpents, gold rain, rain of fire, and marrons; (3) for incendiary purposes, as the carcass, incendiary match, and fire-stone; (4) for light, as tarred links, torches, light-balls, fire-balls, pitched fascines, and parachute-shells; (5) for offensive and defensive purposes, as bags of powder, petards, projectile rockets, as those of Congreve and Hale, light-barrels, and dynamite or nitroglycerin cartridges. The most familiar of the many forms of fireworks is the sky-rocket, whether employed as a signal or for mere display, or as a projectile in war. An important use of the rocket is that of a line-carrier to establish communication between a wrecked vessel and the shore. The Chinese, if not the actual inventors of fireworks, were the first to use the rocket as a missile in war, and the pyrotechnic exhibitions of the Chinese and Japanese still surpass those of all other peoples in ingenuity and splendor. The Japanese have contrived an exhibition of fireworks by daylight, consisting of bombs which, exploding high in air, discharge jets or volumes of colored smoke which take the forms of birds, fishes, trees, and even of human beings. Fireworks are supposed to have been introduced into Europe by the Italians. They are mentioned in a description of a pageant at the marriage of Henry VIII. and Anne Boleyn.

> The king would have me present the princess . . . with some delightful ostentation, or show, or pageant, or antic, or *firework*. *Shak.*, L. L. L., v. 1.

> *Byron*, Cain, ii. 1.

fire-worship (fīr′wėr″ship), *n.* The worship of fire, or of the god of fire, or of the divine as typified by fire; also, the ceremonial cult of a public or a family hearth, as practised, for instance, by all Aryan peoples, by all ancient Greek communities, by the vestal virgins of Rome, and in each ancient Greek and Roman family. The term *fire-worship*, as specifically applied to the religion of the ancient Persians taught by Zoroaster, and practised by their descendants, the Guebers and Parsis of Persia and India, is, if taken literally, a misnomer derived from the Mohammedans, the fire being with these peoples merely a symbol of divinity and a visible sign of their religion. See *Gueber* and *Parsi*.

Fire-worship brings into view again, though under different aspects and with different results, the problems presented by water-worship. The real and absolute worship of fire falls into great divisions, the first belonging rather to fetishism, the second to polytheism proper, and the two apparently representing an earlier and later stage of theological ideas. *E. B. Tylor*, Prim. Culture, II. 251.

> There has been an error in imagining that the Persians and the ancient *fire-worshippers* were idolaters simply of fire, inasmuch as, in bowing down before it, they simply regarded Fire as a symbol, or visible sign, or thing placed as standing for Deity. *H. Jennings*, Rosicrucians, p. 79.
>
> The so-called *Fire-worshippers* certainly do not worship the fire, and they naturally object to a name which seems to place them on a level with mere idolaters.
> *Max Müller*, Chips, I. 169.

When he was seven years old, all the kindred of his father's house, and all the friends thereof, assembled in the inner temple to see the high-priest invest him with the symbolic raiment of the *fire-worshipper*, "the garment of the good and beneficial way."

Thus, by a statute of 1423 the firkin was 84 gallons; while by another of 1482 the firkin of fish was made 21 gallons, being one fourth of a butt and half a barrel. An Irish firkin was half a barrel or 100 pounds.

3. A partnership or association (not a corporation) of two or more persons for doing business; a commercial house; also, the name or title under which associated parties transact business: as, the *firm* of Hope & Co. The name of one only of the partners may be taken as the firm-name: as, the *firm* of Thomas Jones. If, however, only one person is interested in the business, there is no partnership or firm, even though he should use a fictitious addition to make the concern seem one. Present statutes in several jurisdictions forbid the use of firm-names where there is no firm, saving, however, the right, under proper restrictions, of foreign houses, and of continued use of an established name notwithstanding dissolution of the firm it originally represented. A firm is sometimes called a 'concern.'

The *firm* name is part of the good will of a partnership, and where, on a dissolution, one of the partners transfers to the others all his interest in the *firm* business and assets, with the understanding that they are to succeed to the business, the retiring partner cannot use the *firm* name in a business of like kind carried on in the vicinity.
Bouvier.

2. The sky or heavens: the vault of heaven, viewed as something solid and abiding; the region of the air. [The Hebrew word *rakia*, which is so rendered in Scripture, conveys chiefly the idea of expansion, although that of solidity is also suggested, inasmuch as the root signification of the word is 'that which is expanded by beating out.' The English *firmament* is adopted from the Latin *firmamentum*, which is the equivalent of the Greek στερέωμα (< στερεός, firm, solid), by which the writers of the Septuagint rendered *rakia*. Some old astronomers identified the firmament with the orb of the fixed stars; but the word never had any settled and exact meaning in astronomy.]

The difference between a *Firman* and a Hatti Sherif is that, though both are edicts of the Turkish government, the former is signed by any Minister, whereas the latter is approved by the Sultan himself, with his special mark, and is therefore supposed to be irrevocable. These privileges were materially lessened by the treaty of 1818, which gave rise to the vexed questions whether the "three-mile limit" should be run parallel to the shore or from headland to headland, and relating to the rights of American ships in Canadian ports. In 1888 a further treaty dealing with these matters failed of ratification by the U. S. Senate. The Hague Tribunal, Sept. 7, 1910, reëstablished the three-mile limit, recommending certain headlands to define it; allowed United States vessels to carry foreign fishermen; subjected them to reasonable imperial and colonial laws protecting the fisheries; and provided for an impartial commission to settle disputes as to such laws and other matters. Newton, Opticks.

I find nothing so subtly and inconsolably mournful among all the explicit miseries of the Greek mythology as this *fixity* of nature in the god or the man, by which the being is suspended, as it were, at a certain point of growth, there to hang forever. *S. Lanier*, The English Novel, p. 88.

Permanency of type has so many exceptions, that variations of type, and the power to give *fixity* to some of these variations by means of cultivation or environment, must be accepted as a doctrine and a fact. *Science*, X. 289.

Specifically—**2.** In *physics*, the state or property of a body in virtue of which it resists change under the action of heat or other cause.

In regard to the right of severance and removal, the term is used in two directly contradictory senses: (*a*) A chattel so annexed, which has thereby become in law part of the real property, and cannot legally be severed and removed without consent of the owner of the real property. This was the original use. (*b*) A personal chattel so annexed, but which remains in law a chattel, and may be severed and removed at will by the person who has annexed it, or his representative. Originally, chattels became part of the property to which they were attached, and were not legally removable except with the consent of the owner of the real property; but in more recent times the rule has been reversed as to certain kinds of fixtures, such as machinery put by a tenant into premises hired for purposes of trade, etc. Hence the ambiguity in meaning.

★**flag**[2] (flag), *n.* [Early mod. A piece of thin, light fabric, especially bunting, usually rectangular and oblong or square, but sometimes triangular, notched, or otherwise varied in form, ranging from a few inches to several yards in dimensions, used hanging free from a staff to which it is attached or connected by one end, for many purposes, as a signal, symbol, cognizance, or standard, and differing in size, color, and emblematic marking or ornamentation, according to its intended use. The most common employment of flags is as military ensigns, colors, or standards, or emblems of nationality in all its modes of visible manifestation. In the army a flag is a banner by which one regiment is distinguished from another, and is usually called *the colors*. In the navy flags are borne at the masthead not only to designate the nationality of a vessel, but also to indicate the rank of the officer in command, an admiral's presence being denoted by his flag at the main, a vice-admiral carrying his flag at the fore, and

FLAGS OF THE PRINCIPAL NATIONS

a rear-admiral at the mizzen. In the United States navy admirals' flags are blue, with four, three, or two stars, according to rank. When the President goes afloat, his standard, a flag formed of the national coat of arms on a blue field, is displayed in the bow of his barge, or at the main of the man-of-war which receives him. In the British navy the supreme flag is the royal standard, which is to be hoisted only when the sovereign or one of the royal family is on board; the second flag has an anchor on a red ground, and characterizes the lord high admiral or lords commissioners of the admiralty; and the third is the union or national flag, in which the crosses of St. George, St. Andrew, and St. Patrick (the patron saints of England, Scotland, and Ireland respectively) are blended. This flag is appropriated to the admiral of the fleet. The white flag with the red cross of St. George only is appropriated to admirals of lower rank. The American Congress, in session at Philadelphia, established by its resolution of June 14, 1777, a national flag for the United States. It consisted of thirteen stripes, alternate red and white, and thirteen stars, white in a blue field. The adding of two new States (Vermont and Kentucky) changed the flag by act of 1794, and in 1818, when five additional States had been admitted into the Union, Congress decreed that the number of stripes should remain thirteen, but "that on the admission of every new State into the Union, one star be added to the union of the flag, and that such addition shall take effect on the Fourth of July next succeeding such admission." The Confederate flag had a similar union, but bore three bars, two red and one white, instead of the thirteen stripes. Formerly, playhouses exhibited flags when there were performances at them.

During an engagement the bearer may be refused admittance into the lines, or he may be held. A flag of truce is regarded as especially sacred in character and significance, and any abuse of its privileges, as for the purpose of surreptitiously procuring military information, is condemned as an offense of peculiar heinousness. In naval engagements a flag of truce is met at a suitable distance by a boat from the senior officer's ship, in charge of a commissioned officer, and having a white flag plainly displayed from the time of leaving until her return.—**Garrison flag,** a large flag furnished to the principal military posts in the United States, to be displayed on occasions of national importance.—**Knight of the square flag.** See *banneret*2.—**Red flag.** (*a*) A flag of a red color with or without devices, associated with blood or danger: (1) The Roman signal for battle; hence, *to hang out the red* or *bloody flag* is often used, especially by earlier writers, to signify a challenge to battle.

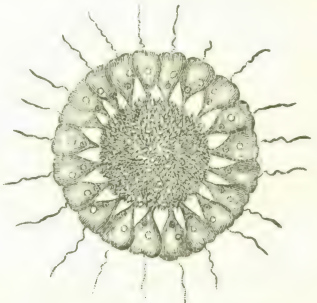
II. *n.* One who whips or scourges himself for religious discipline; specifically, in *hist.*, one of a body of religious persons who believed they could thus appease the divine wrath against their sins and the sins of the age. An association of flagellants founded in Italy about 1260 spread throughout Europe, its members marching in processions, publicly scourging their own bare bodies till the blood ran. Having by these practices given rise to great disorders, they were suppressed; but the same scenes were repeated on a larger scale in 1348 and several subsequent years, in consequence of the desolating plague called the "black death." These flagellants claimed for their scourgings the virtue of all the sacraments, and promulgated other heresies. There have been also fraternities of flagellants authorized by the Roman Catholic Church. Some flagellants have held doctrines opposed to the Roman Catholic Church, and approximating those of Protestantism.



> When, from the corruptness of its ministry, religion has lost its influence, as it did just before the *Flagellants* appeared, the State has been endangered.

Flagellate protozoa, *Oikomonas steinii*, attached to a ball of bacteria: magnified 300 times.

There are generally a nucleus and a contractile vacuole, but no permanent oral aperture, though there is an oral region of the body constituting the food-vacuole, by which food enters along with a globule of water. The function of the flagella is that of locomotory organs. The cell of which a flagellate infusorian mainly consists differs much in form in the different genera, being sometimes prolonged around the base of the flagellum like a collar, and the whole animal may have a shell-like investment. The flagella of the same animal may differ much, one being stout and only occasionally moved, the other forming a delicate cilium in constant vibration. The *Flagellata* multiply by various methods of fission and sporulation, and also by conjugation. Also called *Mastigophora.*—**Flagellata discostomata.** Same as *Choanoflagellata.*—**Flagellata eustomata,** an order of animalcules possessing one or more flagelliform appendages, but no locomotive organs in the form of cilia, a distinct oral aperture or cytostome invariably developed, multiplying by longitudinal or transverse fission, or by the subdivision of a whole or part of the body-substance into sporular elements.—**Flagellata pantostomata,** an order of animalcules simply flagelliferous, having in their characteristic adult state no supplementary lobate or ray-like pseudopodic appendages, oral or ingestive area entirely undefined, food-substances being incepted indifferently at all points of the periphery.

Flame is attended with great heat, and generally with the evolution of much light; but the temperature may be intense when the light is feeble, as is the case with the flame of burning hydrogen gas. The flame of a burning body, as of a candle, may be divided into three zones: an inner zone, containing chiefly unburned gas; a central, containing partially burned gas; and an outer, in which the gas is completely consumed by combination with the oxygen of the air. The luminosity of flame depends upon the presence of solid matter or of dense gaseous products of combustion. The *reducing flame* (as of a blowpipe) is that part of the flame which is deficient in oxygen for combustion (RF in figure), and which has therefore a reducing effect, or, in other words, tends to deprive the substance under examination of oxygen; the *oxidizing flame* is that part (OF in figure) in which the oxygen is in excess, and which exerts the opposite or oxidizing effect. The distinction is important in blowpipe analysis.

The flowers are blue. The seeds, known as *linseed* and *flaxseed*, are very mucilaginous, and are used on that account in medicine. They also yield an oil, which is extensively used by painters; and the residue, called *linseed-cake*, has much value as feed for cattle. The office of grand master passed to the house of Hapsburg in 1477 with the acquisition of the Burgundian dominions, which included the Netherlands. After the time of the emperor Charles V. It is usually of a light-gray or brownish color. It has a peculiarly well-marked conchoidal fracture, and can easily be broken up into fragments having sharp cutting edges. For this reason, and because of its hardness, which is proverbial, flint was most extensively used in prehistoric times for all kinds of cutting implements. The use of flint as a means of striking fire with a steel, and especially as a part of the once almost universally used musket-lock, is well known. Flint occurs in large quantity in the form of nodules, and even sheets or beds, in the chalk of England and France, and has been formed by the slow replacement of carbonate of lime by silica held in solution in water. It is abundant in the United States, generally in massive forms. The exterior of most flints is of a lighter color than the interior, this difference being caused by a rearrangement of the particles of the silica.

They consist of arrowheads, ax-heads or celts, lance-heads, knives, etc. Flint implements have been found in many regions of the globe; often, as in the Somme valley in France, in beds of drift, and in connection with the remains of extinct species of the elephant, rhinoceros, and other mammals, whence man's existence on the globe at a geological period anterior to the present has been inferred. Flint implements are still used by some primitive tribes.

flint-glass (flint′glȧs), *n.* A variety of glass in which the silica is combined with oxid of lead in greater or less quantity. The larger the amount of lead the higher the specific gravity and the refractive power, and the greater the brilliancy of the product. Flint-glass is often called *crystal glass*, or simply *crystal*, while some limit the name *flint-glass* to the variety specially made for optical purposes. Besides the oxid of lead, potash is an essential ingredient of flint-glass or crystal. Analyses of different kinds of crystal show the presence of from 28 to 37 per cent. of oxid of lead, 14 to 17 of potash, and 52 to 59 of silica. The flint-glass of Guinand, used for optical purposes and generally admitted to be of unrivalled excellence, contains about 43 per cent. of oxid of lead and 12 of potash. The brilliancy of crystal glass fits it for use for ornamental purposes, and especially for the most showy and expensive table-ware. The characteristic luster and sparkle due to the high refractive power of the material is brought out by cutting and polishing, exactly as is done in the case of gems. Owing, however, to its softness, crystal glass is easily scratched by careless handling and dulled by wear. The name *flint-glass* originated in the fact that the silica first used in England for the manufacture of this article was derived from flints. An essential requisite for good flint-glass is purity of the materials employed, and the forms of the furnace and of the melting-pots are peculiar. Great technical skill is required for the production of the best kind of glass for optical purposes. See *glass*, *strass*, and *lens*.

I assisted at the birth of that most significant word *flirtation*, which dropped from the most beautiful mouth in the world, and which has since received the sanction of our most accurate Laureat in one of his comedies. Some inattentive and undiscerning people have, I know, taken it to be a term synonymous with coquetry: but I lay hold of this opportunity to undeceive them, and eventually to inform Mr. Johnson that *flirtation* is short of coquetry, and intimates only the first hints of approximation, which subsequent coquetry may reduce to those preliminary articles that commonly end in a definite treaty.

II. *n.* **1.** A substance which flows or is capable of flowing; a substance which is incapable of resisting forces (tangential stresses) tending to change its shape without altering its size. A *fluid* has absolutely no tendency to spring back to its original shape when distorted, except in virtue of a surface tension. A *perfect fluid* is a fluid in which a bending stress produces an instantaneous strain — that is to say, there is no delay in taking a form of equilibrium, except what is due to the masses of the particles: opposed to a *viscous fluid*, in which the yielding is not instantaneous, and to a *plastic solid*, which yields instantaneously to a sufficient, but not to a very small, stress. Fluids are divided into liquids and gases or vapors. Gases or *elastic fluids* tend to

expand indefinitely while preserving their homogeneity; liquids or *inelastic fluids* tend to expand indefinitely, but only by evaporation — that is, by separating into two parts with a bounding surface between them. (See *liquid*, *gas*, and *ether*.) In the early history of physical science the phenomena of heat, electricity, and magnetism were supposed to be due to the motions of peculiar imponderable fluids; hence the expressions *north* and *south magnetic fluid*, the *electrical fluid*, etc., which still linger (but not with good writers), though the explanation of the phenomena has changed with the advance of knowledge.

A *fluid* is a body the contiguous parts of which act on one another with a pressure which is perpendicular to the surface which separates those parts.

Clerk Maxwell, Heat, p. 95.

The most pronounced fluidal texture occurs in semi-glassy lavas where minute microlites or trichites have been dragged by the motion into delicate parallel trains, which wrap about the larger crystals (see figure). While this texture is most distinct where the mineral particles are small and acicular, it may be recognizable where the crystals are large and irregular. Also called *flow-structure* and *fluxion-structure*.

★**fluidism** (flö′i-dizm), *n.* [< *fluid* + *-ism*.] The hypothesis that there exists a supersensible or so-called fluidic body associated with every living body, and not confined entirely to the space occupied by the latter. Flumes for conducting water to mill-wheels are open or covered passages formed of boards, planks, or stone, by which the water is led to the penstock. In gold-mining regions flumes for furnishing water as a power in hydraulic mining are often extensive structures of planks, carried on heavy timbers over gullies, ravines, or valleys. fluorescence (flö-ō-res′ens), *n.* [= F. *fluorescence* = Sp. Pg. *florescencia*; as *fluorescen*(*t*) + *-ce*.] The property possessed by some transparent substances of becoming self-luminous while they are exposed to the direct action of light-rays. See *phosphorescence*. It is excited by those rays which correspond in wave-length to an absorption-band in the spectrum of the light transmitted by the fluorescent substance. The fluorescent light corresponds in wave-length with the less refrangible edge of the absorption-band. Thus, if a beam of sunlight fall upon a solution of esculin or sulphate of quinine, its path through the liquid is marked by a bluish light. Again, if a paper moistened with the solution is exposed to the ultra-violet rays of the spectrum, it becomes blue, since these rays are diminished in refrangibility so as to become visible; by this means the ultra-violet spectrum can be studied. The delicate blue surface-color of some fluor-spar and the yellowish-green surface-color of glass colored with uranium oxid (canary glass) are phenomena of the same nature. For some years previous to 1852 the phenomenon was termed *epipolic dispersion*.

★ **fluorescent** (flö-ō-res′ent), *a.* [= F. *fluorescent* = Pg. *florescente*; as *fluoresce* + *-ent*.] Possessing the property of fluorescence; exhibiting fluorescence.—**Fluorescent eyepiece**, a form of eyepiece, as that of Soret, used with the spectroscope in examining the ultra-violet spectrum made visible by fluorescence

A gaseous element, isolated for the first time by Moissan in 1886 by electrolysis of hydrofluoric acid. It forms with other elements a group of compounds called *fluorides*. The commonest of these is calcium fluoride, or fluor-spar. Fluorin occurs principally in the mineral kingdom, as in fluor-spar, cryolite, and other minerals, and also in minute quantity in the teeth and bones of animals.

fluorite (flö′ō-rīt), *n.* [< *fluor* + *-ite*[2].] Same as *fluor-spar*.

fluoroscope (flö′ȯr-ō-skōp), *n.* An apparatus designed for observing the effect of the Röntgen rays by means of their action on a fluorescent substance. It consists essentially of a tube or box closed at one end by a screen coated with a fluorescent substance, as tungstate of calcium. When an object, as the hand, placed before a vacuum-tube is observed through the fluoroscope, the shadows of its parts that are not transparent to the X-rays are seen on the fluorescent screen.

fluor-spar (flö′ȯr-spär), *n.* [< *fluor*, a flow, flux (see def.), + *spar*[1].] A common mineral, the fluoride of calcium, CaF_2, found in great beauty in Derbyshire, England, and hence also called *Derbyshire spar*. It occurs both massive and crystallized, in simple forms of the isometric system, namely the cube, octahedron, dodecahedron, etc., and in combinations of these. Pure fluor-spar contains 48.7 per cent. of fluorin and 51.3 of calcium. It is of frequent occurrence, especially in connection with metalliferous beds, as of silver, tin, lead, and cobalt ores. It is sometimes colorless and transparent, but more frequently exhibits tints of yellow, green, blue, and red. From the general prevalence of a blue tint in the Derbyshire specimens, it is there known as *blue-john*. It is often beautifully banded, especially when in nodules, which are much prized for the manufacture of vases, and occasionally used for beads, brooch-stones, and other ornamental purposes, although it is of inferior hardness. Some varieties exhibit a bluish fluorescence; and all kinds phosphoresce on gentle heating, especially the variety chlorophane, which emits a beautiful green light. The name *fluor* has reference to its use as a flux to promote the fusion of certain refractory minerals. Also called *fluorite*.

fluosilicate (flö-ō-sil′i-kāt), *n.* [< *fluosilic-ic* + *-ate*[1].] **1.** In *chem.*, a compound of fluosilicic acid with some base.—**2.** In *mineral.*, a silicate containing fluorin as an essential part. See *fluophosphate*.

This acid may be obtained by applying a gentle heat to a mixture of one part of powdered fluor-spar, one of silica, and two of sulphuric acid, in a retort, and passing the gas obtained (SiF_4) into water, where it decomposes, giving fluosilicic acid and silicic acid.

[flush. The several words spelled *flush*, being mostly dialectal, colloquial, or technical, and scantily recorded in early literature, have become partly confused with one another, and cannot now be entirely disentangled. Words originally different have acquired some meanings very nearly identical, while on the other hand there are some meanings not obviously related which are, nevertheless, to be referred to one original. The separation made in the following articles is based on the present differences of sense, and is probably more minute than the etymology, if fully known, would require.]

In *music*, an instrument of the pipe kind, in which the tone is produced by the impact of a current of air upon the edge of a hole in the side of a tube. See *pipe*, *fife*. having a mouth-hole in the side of the tube, which is held across the player's body. In both species finger-holes in the tube control the pitch of the tones; and in both increased force in blowing raises the pitch an octave. It is asserted that the stream of air, being usually flat, acts like a free reed in the opening, playing back and forth like a solid tongue.
